

- I chose this data because I thought they might be related. As it turns out, my visualisation shows quality of life and purchasing power are indeed related (one would almost think the purchasing power is a factor in calculating quality of life).
- I chose green for the quality of life because it is a bright happy colour. I picked yellow for the safety index, as it's not only bright and happy (safe) but also usually associated with safety (think safety vests).
- The user has to click on the name of the country instead of the bar. This is kind of counterintuitive, but I opted for that option because of the sanity of the programmer (me) (the entire data structure would have to be re-worked).
- Upon loading, the site gives an error, as it cannot load the line for data that does not exist. I figured this was fine, since the average user doesn't open the console to check the site.
